

# Farmacia Regine Inventory System

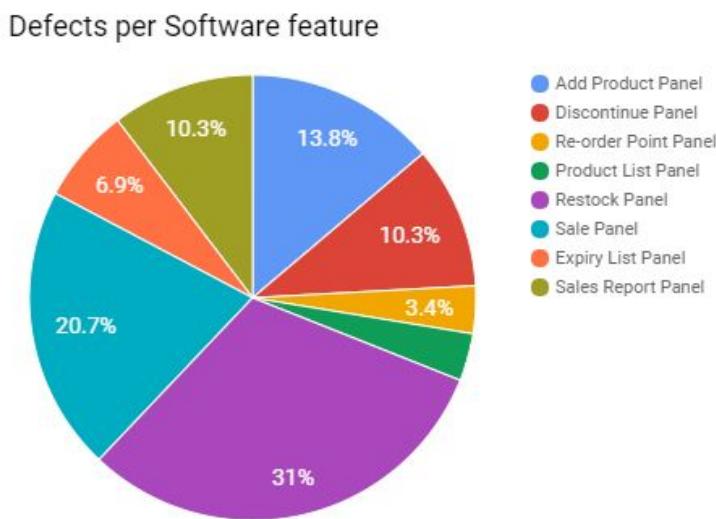

## Test Report

INTROSE S21

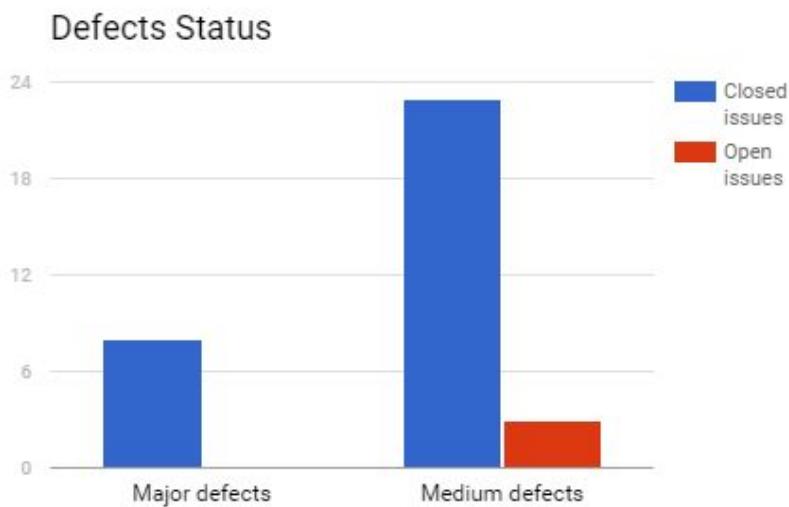

The report elaborates on the testing activities performed on the Farmacia Regine Inventory System software.

Eighty-one test cases were made to test the functionality of the following software features: Add Product Panel, Discontinue Panel, Re-order Point Panel, Product List Panel, Restock Panel, Sale Panel, Expiry List Panel, and Sales Report Panel. Testing was also performed to check if the software can execute the basic processes, such as managing product stocks, creating sale transactions and reports, done in an inventory system. Out of all the test cases that were made and performed, seven were failed test cases. But upon re-testing these 7 failed cases, it eventually passed.

The total number of defects found in the software is thirty-six. The frequency count of defects found for each of the software features is presented in the chart below.

Of the thirty-six defects found in the software, three are currently open issues and thirty-three are closed issues.

The team is currently working on those fixes. Although, the User Acceptance Test has already been done. With some revisions from the suggestions of the clients, and the fixes of the issues currently posted in the Github repository, the team hopes to improve and be cleared for the next demo which will be held on July 26, 2016.
